fundamentals of conservation biology this book is about hope in the face of forces that would degrade our world this book is about the rich tapestry of life that shares our world now and about how we can maintain it sometimes in places that we protect and set aside more often in places where we share the lands and waters with a wide range of other species for more than 30 years fundamentals of conservation biology has been a valued mainstay of the literature serving both to introduce new students to this ever changing topic and to provide an essential resource for academics and researchers working in the discipline in the decade since the publication of the third edition concerns about humanity's efforts to conserve the natural world have only grown deeper as new threats to biodiversity continue to emerge this fourth edition has taken into account a vast new literature and boasts nearly a thousand new references as a result by embracing new theory and practice and documenting many examples of both conservation successes and the hard lessons of real world wicked environmental problems fundamentals of conservation biology remains a vital resource for biologists conservationists ecologists environmentalists and others

in the new edition of this highly successful book malcolm hunter and new co author james gibbs offer a thorough introduction to the fascinating and important field of conservation biology focusing on what can be done to maintain biodiversity through management of ecosystems and populations starting with a succinct look at conservation and biodiversity this book progresses to contend with some of the subject's most complex topics such as mass extinctions ecosystem degradation and over exploitation discusses social political and economic aspects of conservation biology thoroughly revised with over six hundred new references and web links to many of the organizations involved in conservation biology striking photographs and maps artwork from the book is available to instructors online at blackwellpublishing.com hunter and by request on cd rom

this colourful textbook introduces students to conservation biology the science of preserving biodiversity

following the much acclaimed success of the first volume of key topics in conservation biology this entirely new second volume addresses an innovative array of key topics in contemporary conservation biology written by an internationally renowned team of authors key topics in conservation biology 2 adds to the still topical foundations laid in the first volume published in 2007 by exploring a further 25 cutting edge issues in modern biodiversity conservation including controversial subjects such as setting conservation priorities balancing the focus on species and ecosystems and financial mechanisms to

value biodiversity and pay for its conservation other chapters setting the framework for conservation address the sociology and philosophy of peoples relation with nature and its impact on health and such challenging practical issues as wildlife trade and conflict between people and carnivores as a new development this second volume of key topics includes chapters on major ecosystems such as forests islands and both fresh and marine waters along with case studies of the conservation of major taxa plants butterflies birds and mammals a further selection of topics consider how to safeguard the future through monitoring reserve planning corridors and connectivity together with approaches to reintroduction and re wilding along with managing wildlife disease a final chapter by the editors synthesises thinking on the relationship between biodiversity conservation and human development each topic is explored by a team of top international experts assembled to bring their own cross cutting knowledge to a penetrating synthesis of the issues from both theoretical and practical perspectives the interdisciplinary nature of biodiversity conservation is reflected throughout the book each essay examines the fundamental principles of the topic the methodologies involved and crucially the human dimension in this way key topics in conservation biology 2 like its sister volume key topics in conservation biology embraces issues from cutting edge ecological science to policy environmental economics governance ethics and the practical issues of implementation key topics in conservation biology 2 will like its sister volume be a valuable resource in universities and colleges government departments and conservation agencies it is aimed particularly at senior undergraduate and graduate students in conservation biology and wildlife management and wider ecological and environmental subjects and those taking masters degrees in any field relevant to conservation and the environment conservation practitioners policy makers and the wider general public eager to understand more about important environmental issues will also find this book invaluable

this primer is divided into five chapters focusing on biological diversity and its value the threats to biological diversity conservation at the population and species levels protecting and managing habitats and ecosystems and human societies and sustainable development case studies demonstrate the controversies in the field the choice of examples show the full range of species habitats and geographic areas of the world

john harper nature conservation has changed from an idealistic philosophy to a serious technology ecology the science that underpins the technology of conservation is still too immature to provide all the wisdom that it must it is arguable that the desire to conserve nature will in itself force the discipline of ecology to identify fundamental problems in its scientific goals

and methods in return ecologists may be able to offer some insights that make conservation more practicable harper 1987 the idea that nature species or communities is worth preserv ing rests on several fundamental arguments particularly the argu ment of nostalgia and the argument of human benefit and need nostalgia of course is a powerful emotion with some notable ex ceptions there is usually a feeling of dismay at a change in the sta tus quo whether it be the loss of a place in the country for walking or rambling the loss of a painting or architectural monument or that one will never again have the chance to see a particular species of bird or plant

reflecting a new generation of conservation biologists upper division and graduate level conservation biology courses as well as for individual reference this book incorporates a number of new authors and additional chapters covering all aspects of one of the most dynamic areas in the life sciences containing ten additional chapters it includes such timely topics as ecosystem management and the economics of conservation

conservation biology is fast emerging as a major new discipline which incorporates biological principles in the design of effective strategies for the sustainable management of populations species and entire ecosystems this beautifully illustrated textbook introduces students to conservation biology the science of preserving biodiversity it begins by taking the reader on a tour of the many and varied ecosystems of our planet providing a setting in which to explore the factors that have led to the alarming loss of biodiversity that we now see in particular the fundamental problems of habitat loss and fragmentation habitat disturbance and the non sustainable exploitation of species in both aquatic and terrestrial ecosystems are explored the methods that have been developed to address these problems from the most traditional forms of conservation to new approaches at genetic to landscape scales are then discussed showing how the science can be put into practice

this introductory textbook examines diminishing terrestrial and aquatic habitats in the tropics covering a broad range of topics including the fate of the coral reefs the impact of agriculture urbanization and logging on habitat depletion and the effects of fire on plants and animal survival includes case studies and interviews with prominent conservation scientists to help situate key concepts in a real world context covers a broad range of topics including the fate of the coral reefs the impact of agriculture urbanization and logging on habitat depletion and the effects of fire on plants and animal survival highlights conservation successes in the region and emphasizes the need to integrate social issues such as human hunger into a tangible conservation plan documents the current state of the field as it looks for ways to predict future outcomes and lessen

human impact sodhi et al have done a masterful job of compiling a great deal of literature from around the tropical realm and they have laid out the book in a fruitful and straightforward manner i plan to use it as a reference and as supplemental reading for several courses and i would encourage others to do the same ecology 90 4 2009 pp 1144 1145

conservation biology for all provides cutting edge but basic conservation science to a global readership a series of authoritative chapters have been written by the top names in conservation biology with the principal aim of disseminating cutting edge conservation knowledge as widely as possible important topics such as balancing conservation and human needs climate change conservation planning designing and analyzing conservation research ecosystem services endangered species management extinctions fire habitat loss and invasive species are covered numerous textboxes describing additional relevant material or case studies are also included the global biodiversity crisis is now unstoppable what can be saved in the developing world will require an educated constituency in both the developing and developed world habitat loss is particularly acute in developing countries which is of special concern because it tends to be these locations where the greatest species diversity and richest centres of endemism are to be found sadly developing world conservation scientists have found it difficult to access an authoritative textbook which is particularly ironic since it is these countries where the potential benefits of knowledge application are greatest there is now an urgent need to educate the next generation of scientists in developing countries so that they are in a better position to protect their natural resources

we wrote this book to inspire the next generation of conservation biologists to help humans become better stewards of the world s biodiversity in doing so our desire was to fill two key gaps in the education of most conservation biologists that are beginning their studies this first gap is interdisciplinary training most textbooks of conservation and most university courses in conservation focus on the discipline s historical roots in the natural sciences e g botany ecology and disciplines of natural resource management e g forestry fisheries wildlife management but conservation is no longer a group of ecologists wildlife biologists or fisheries scientists trying to save their favorite species in a dwindling habitat the modern practice of conservation relies on numerous disciplines from the social sciences that account for human behaviors values needs and decision making modern conservation relies on disciplines from engineering and architecture to help plan design and construct practical solutions to problems and finally modern conservation relies on disciplines from the humanities that compose law and policy and that communicate effectively through literature art and photography numerous examples and exercises from these

fields have been woven into this textbook to help improve interdisciplinary training the second gap we see in the education of conservation professionals is skills based training over the past few decades many universities have eliminated course requirements in biology chemistry physics and math as demand for bachelor of science degrees has waned and demand for bachelor of arts programs has increased e g bas in environmental sciences earth science conservation ecology etc many textbooks have been written to support ba programs that focus on giving students broad introductions to fields like conservation biology but few texts develop the depth of methods tools and techniques that students will need to be successful practitioners in the field we have carefully chosen the most important quantitative concepts methods tools techniques and models that students need for a career in conservation and we explain those in simple terms while also providing the practice needed to master these new skills given our focus on more interdisciplinary skills based training this book is written for aspiring conservation biologists who need more advanced training than is typically offered in an introductory level class conservation biology 2e supports courses for upper division undergraduates who have already had some introduction to environmental science ecology wildlife biology forestry or other fields related to conservation this book can also be used for entry level graduate courses such as those in the growing number of professional master s programs that provide advanced degrees in environmental science policy management or sustainability

this book provides a thorough up to date examination of conservation biology and the many supporting disciplines that comprise conservation science in this the third edition of the highly successful conservation biology foundations concepts applications the authors address their interdisciplinary topic as it must now be practiced and perceived in the modern world beginning with a concise review of the history of conservation the authors go on to explore the interplay of conservation with genetics demography habitat and landscape aquatic environments and ecosystem management and the relationship of all these disciplines to ethics economics law and policy an entirely new chapter the anthropocene conservation in a human dominated nature breaks new ground in its exploration of how conservation can be practiced in anthropogenic biomes novel ecosystems and urban habitats the third edition includes the popular points of engagement discussion questions used in earlier editions and adds a new feature information boxes which briefly recap specific case histories described in the text a concluding chapter offers insight into how to become a conservation professional in both traditional and non traditional roles the authors fred van dyke and rachel lamb draw on their expertise as field biologists wildlife managers consultants to government and industry and scholars of environmental law policy and advocacy as well as their many years of effective

teaching experience informed by practical knowledge and acquired skills the authors have created a work of exceptional clarity and readability which encompasses both systemic foundations as well as contemporary developments in the field conservation biology foundations concepts applications will be of invaluable benefit to undergraduate and graduate students as well as to working conservation scientists and managers this is an amazing resource for students faculty and practitioners both new and experienced to the field diane debinski phd unexcelled wisdom for living at home on wonderland earth the planet with promise destined for abundant life holmes rolston phd van dyke and lamb have maintained the original text s emphasis on connecting classical ecological and environmental work with updated modern applications and lucid examples but more importantly the third edition contains much new material on the human side of conservation including expanded treatments of policy economics and climate change tim van deelen phd fred van dyke and rachel lamb break new ground in both the breadth and depth of their review and analysis of this crucially important and rapidly changing field any student or other reader wishing to have a comprehensive overview and understanding of the complexities of conservation biology need look no further this book is your starting point simon n stuart phd anyone who teaches talks or writes and works on conservation biology needs this latest edition of conservation biology foundations concepts applications 3rd edition by fred van dyke and rachel l lamb this will be useful to both beginners and experts as well the authors included almost all important issues in relation to conservation biology this is really an outstanding book bidhan chandra das professor ecology branch department of zoology university of rajshahi bangladesh

this is the first introductory text on conservation biology to focus clearly on southern australia and the problems that face its native animals and plants and their habitats as a result of human interference beginning with a comprehensive discussion of the broad principles of conservation biology and its importance in australia conservation biology covers the development of conservation practice and theory in australia using local examples to provide a framework for understanding the extent and nature of the need for conservation in southern australia extinction and its significance the meanings levels and interpretation of the concept of biodiversity the notion of rarity and its evaluation in terms of establishing the conservation status of flora and fauna approaches to species and ecosystem conservation including reserve design and setting priorities for conservation management conservation beyond reserves and ex situ conservation encompassing captive breeding and reintroduction the considerable number of threats to species and ecosystems australia s conservation responsibilities in a global context conservation biology features a series of topical case histories that highlight management issues and some of the successes

and disappointments that have occurred and each chapter includes suggestions for further reading

one of the fastest growing scientific disciplines in recent history is conservation biology a response of the scientific community to the massive environmental changes taking place on earth its goal is to enable society to anticipate prevent and reduce ecological damage and to generate the scientific information from which effective conservation strategies and policies can be designed and implemented in 1989 the society for conservation biology and island press produced research priorities for conservation biology a slim volume that set forth the findings of experts who had gathered to outline research needs for the near future and which served as a guidepost for the field throughout the 1990s in january 2000 leaders of the society for conservation biology convened a similar group to reach consensus on where the field now stands and to determine the major compelling research priorities for the next decade conservation biology research priorities for the next decade presents the results of that gathering the book notes progress or changes in the state of global biodiversity over the past decade and discusses overarching themes that influence all areas of conservation offers ten chapters by leading experts that summarize the status of knowledge in key areas ranging from marine conservation to ecological restoration to conservation medicine sets forth research priorities for each area describes gaps in current knowledge that are impeding the ability of conservation practitioners to carry out their work a final synthesis chapter brings together cross cutting themes that integrate the diverse topics within the context of global biodiversity loss and presents a call to action for scientists and others working in the field conservation biology research priorities for the next decade represents an indispensable guide to the research that is most urgently needed to support effective conservation and will be must reading for anyone involved with the field of conservation biology

we are living in the early stages of a looming worldwide extinction crisis abundant evidence shows that the current rate of species extinctions is nearing its highest level since the asteroid collision 65 million years ago and that humans are largely responsible this book addresses the urgent need to understand and find solutions to this crisis written by an international team of contributors who are among the best known and most active experimental biologists working in the field of conservation biology today it provides a unique approach by focusing on individual species rather than whole plant and animal communities emphasizing throughout how conservation biology can benefit from an experimental approach the book looks at a wide range of terrestrial and aquatic species from giant pandas and tree snails to sea turtles and steller sea lions

and demonstrates what can be done both to preserve rare species and to combat invasive organisms finally contributors show how we can bridge the gap between policy makers and research scientists in order to develop lasting solutions to these problems
